Linked List Wrapup + Introduction to Sorting

What is a problem/challenge in your everyday life that you feel empowered to solve with CS?

(put your answers the chat)

Today's questions

How can we implement linked list operations that require rewiring multiple elements?

What are real-world algorithms that can be used to organize data?

Today's topics

1. Review

Advanced Linked List Operations

3. Introduction to Sorting Algorithms

Review

[linked list operations]

Yesterday

- Linked lists can be used outside classes you'll do this on Assignment 5!
- Think about when you want to pass pointers by reference in order to edit the original pointer and to avoid leaking memory.

Traversal

How do we walk through all elements in the linked list?

Rewiring

How do we rearrange the elements in a linked list?

Insertion

O How do we add an element to a linked list?

Deletion

Traversal

How do we walk through all elements in the linked list?

Rewiring

How do we rearrange the elements in a linked list?

Insertion

O How do we add an element to a linked list?

Deletion

Three applications of traversal

- Printing a linked list
- Measuring a linked list
- Freeing a linked list

```
/* Note: This looks a little different for freeing */
while (list != nullptr) {
    // DO SOMETHING
    list = list->next;
}
```

Linked List Traversal Takeaways

- Temporary pointers into lists are very helpful!
 - When processing linked lists iteratively, it's common to introduce pointers that point to cells in multiple spots in the list.
 - This is particularly useful if we're destroying or rewiring existing lists.
- Using a while loop with a condition that checks to see if the current pointer is nullptr is the prevailing way to traverse a linked list.
- Iterative traversal offers the most flexible, scalable way to write utility functions that are able to handle all different sizes of linked lists.

Traversal

How do we walk through all elements in the linked list?

Rewiring

How do we rearrange the elements in a linked list?

Insertion

O How do we add an element to a linked list?

Deletion

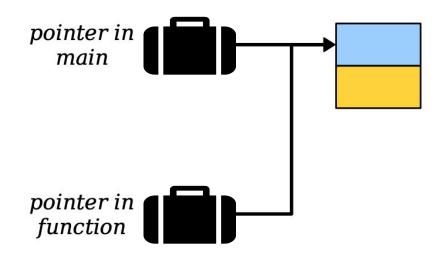

Two ways to add (so far)

- Insertion at the front: prependTo()
 - Prepending is faster but results in a reversed order of items (things added earlier are at the back of the list)
- Insertion at the back: appendTo()
 - Appending requires traversing all items but maintains order (things added earlier are at the front of the list)

```
void nameOfAddFunction(Node*& list, string data) {
    ...
}
```

Pointers by Value

- Unless specified otherwise, function arguments in C++ are passed by value – this includes pointers!
- A function that takes a pointer as an argument gets a copy of the pointer.
- We can change where the copy points, but not where the original pointer points.

Unresolved Issue

• What is the big-O complexity of appending to the back of a linked list using our algorithm?

Unresolved Issue

- What is the big-O complexity of appending to the back of a linked list using our algorithm?
- Answer: O(n), where n is the number of elements in the list, since we have to find the last position each time.

Unresolved Issue

- What is the big-O complexity of appending to the back of a linked list using our algorithm?
- **Answer:** O(n), where n is the number of elements in the list, since we have to find the last position each time.
- This seems suspect O(n) for a single insertion is pretty bad! Can we do better?

More Linked Lists!

Traversal

How do we walk through all elements in the linked list?

Rewiring

How do we rearrange the elements in a linked list?

Insertion

O How do we add an element to a linked list?

Deletion

Traversal

O How do we walk through all elements in the linked list?

Rewiring (by inserting and deleting in the middle of a list!)

How do we rearrange the elements in a linked list?

Insertion

How do we add an element to a linked list?

Deletion

A more efficient append

A more efficient appendTo()

- Yesterday, we saw an O(n) appendTo() that added to the back of a linked list.
 We can do better!
- What if we know we're going to add many things in some maintained order?
- Specifically, we'll use the example of adding items from a vector into linked list.

Attempt #1

```
Node* createListWithAppend(Vector<string> values) {
   if (values.isEmpty()) {
       return nullptr;
   Node* head = new Node(values[0], nullptr);
   for (int i = 1; i < values.size(); i++) {</pre>
       appendTo(head, values[i]);
   return head;
```

Attempt #1: What's the runtime? (poll)

```
Node* createListWithAppend(Vector<string> values) {
   if (values.isEmpty()) {
       return nullptr;
   Node* head = new Node(values[0], nullptr);
                                                       O(N)
                                                   B. O(N^2)
   for (int i = 1; i < values.size(); i++) {</pre>
       appendTo(head, values[i]);
   return head;
```

Attempt #1: What's the runtime? (poll)

```
Node* createListWithAppend(Vector<string> values) {
   if (values.isEmpty()) {
       return nullptr;
   Node* head = new Node(values[0], nullptr);
                                                      O(N)
   for (int i = 1; i < values.size(); i++) {</pre>
       appendTo(head, values[i]);
   return head;
```

Attempt #2: append() – Let's code it!

How does it work?

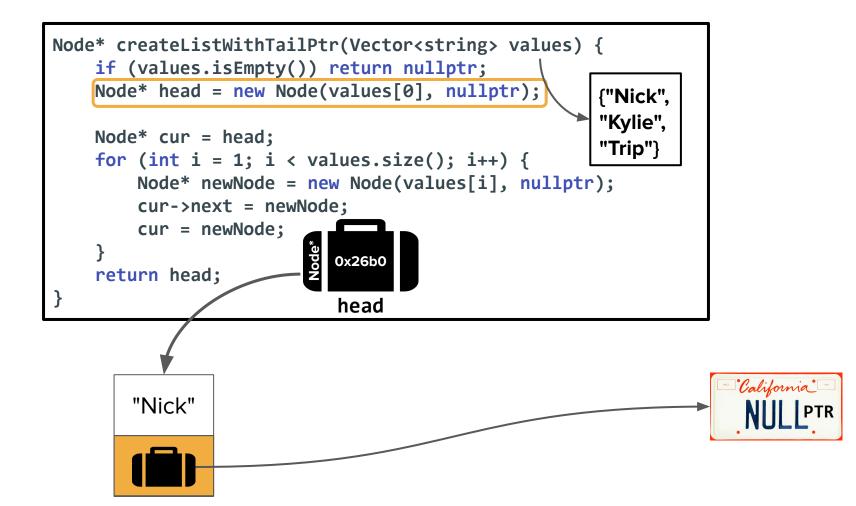

```
int main() {
    Vector<string> values = {"Nick", "Kylie", "Trip"};
    Node* list = createListWithTailPtr(values);

    /* Do other list-y things here, like printing/freeing the list. */
    return 0;
}
```

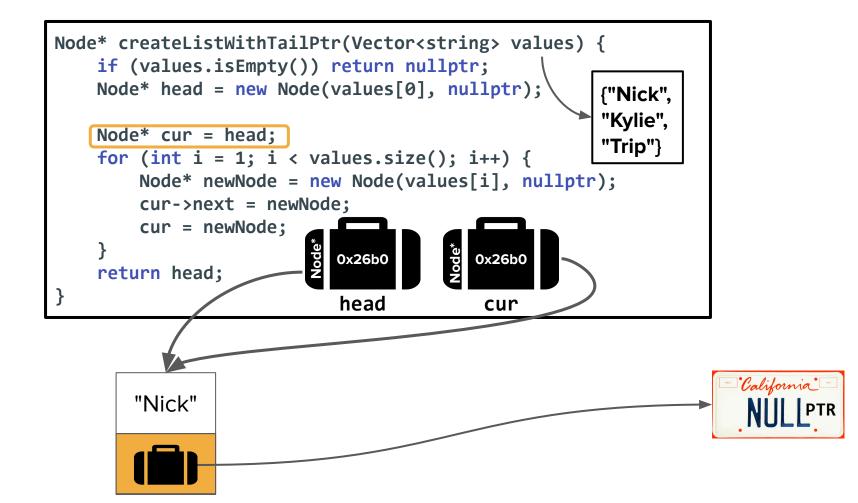

```
Node* createListWithTailPtr(Vector<string> values) {
    if (values.isEmpty()) return nullptr;
    Node* head = new Node(values[0], nullptr);
                                                      {"Nick",
                                                      "Kylie",
    Node* cur = head;
                                                      "Trip"}
    for (int i = 1; i < values.size(); i++) {</pre>
        Node* newNode = new Node(values[i], nullptr);
        cur->next = newNode;
        cur = newNode;
    return head;
```

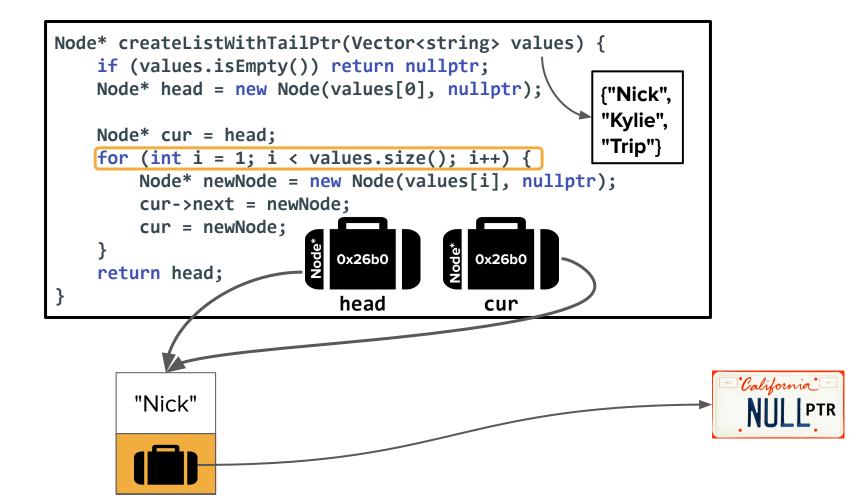

```
Node* createListWithTailPtr(Vector<string> values) {
    if (values.isEmpty()) return nullptr;
    Node* head = new Node(values[0], nullptr);
                                                      {"Nick",
                                                      "Kylie",
    Node* cur = head;
                                                      "Trip"}
    for (int i = 1; i < values.size(); i++) {</pre>
        Node* newNode = new Node(values[i], nullptr);
        cur->next = newNode;
        cur = newNode;
    return head;
```

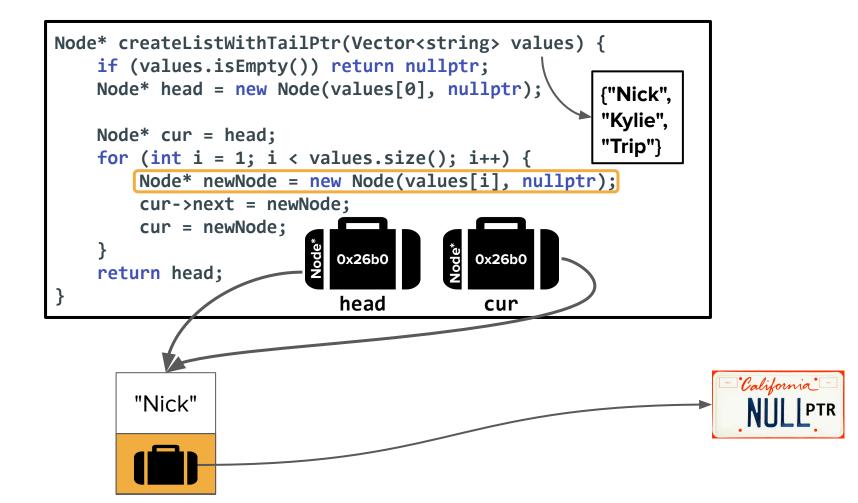

```
Node* createListWithTailPtr(Vector<string> values) {
    if (values.isEmpty()) return nullptr;
    Node* head = new Node(values[0], nullptr);
                                                      {"Nick",
                                                      "Kylie",
    Node* cur = head;
                                                      "Trip"}
    for (int i = 1; i < values.size(); i++) {</pre>
        Node* newNode = new Node(values[i], nullptr);
        cur->next = newNode;
        cur = newNode;
    return head;
```

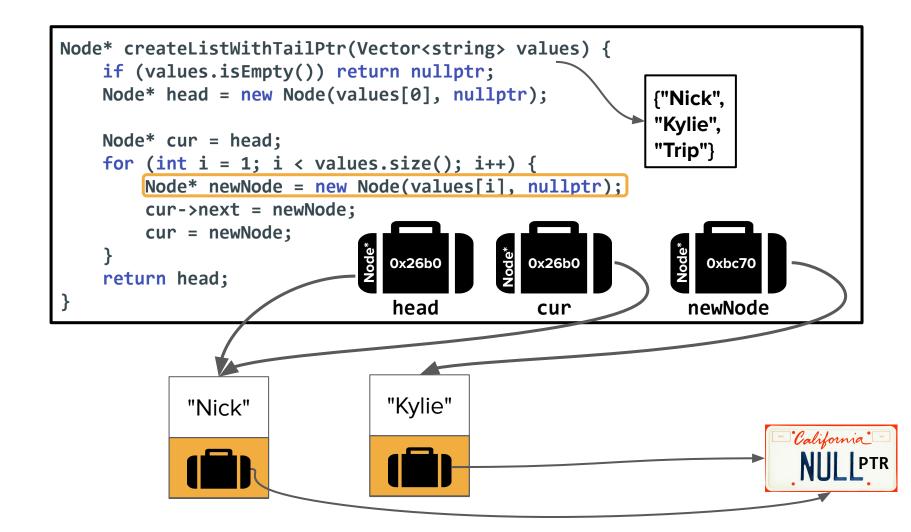

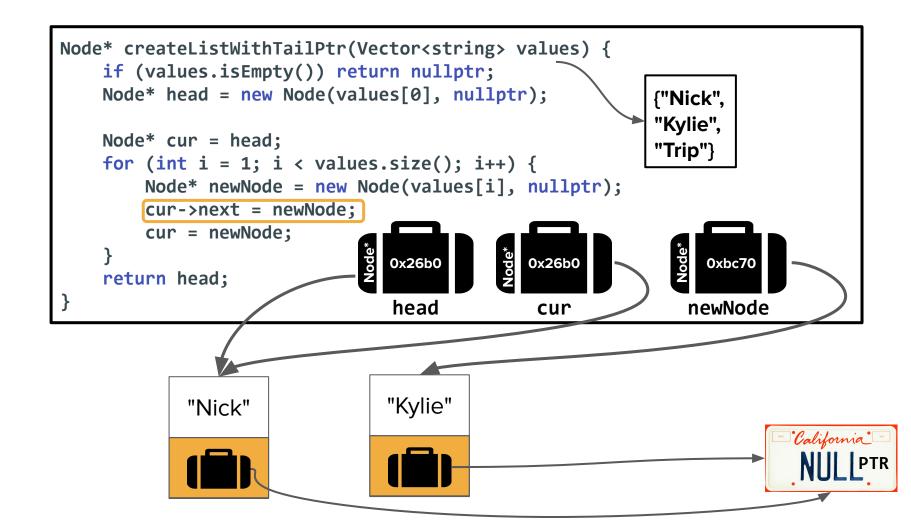

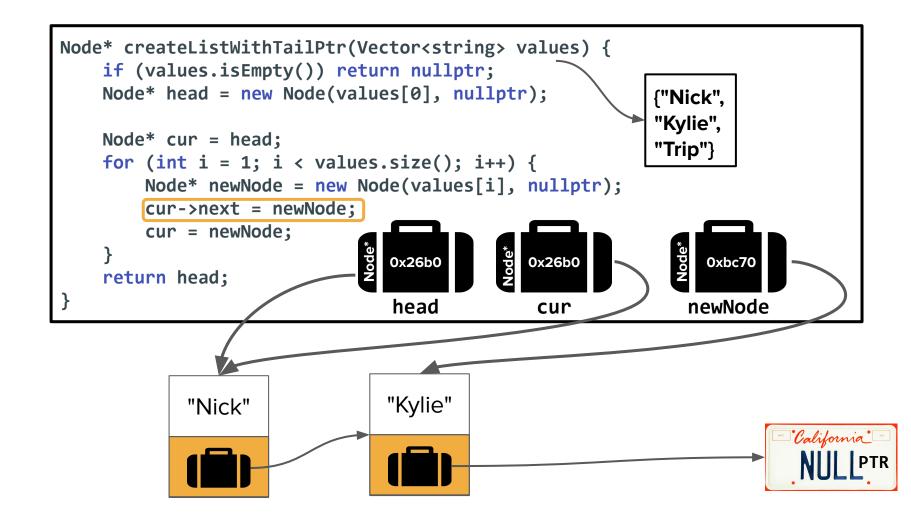

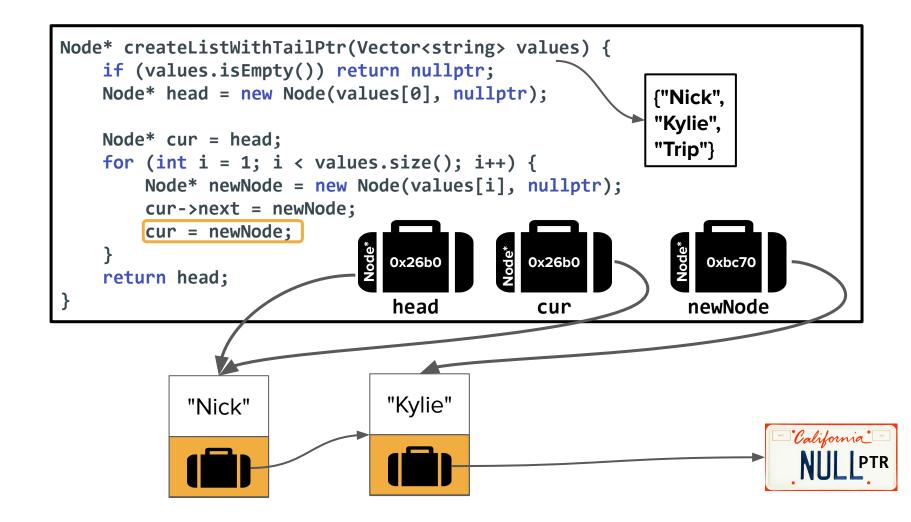

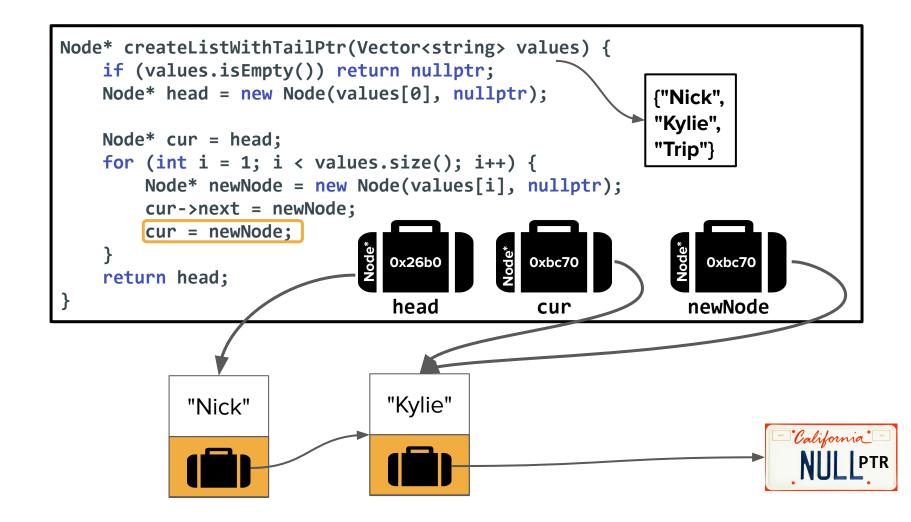

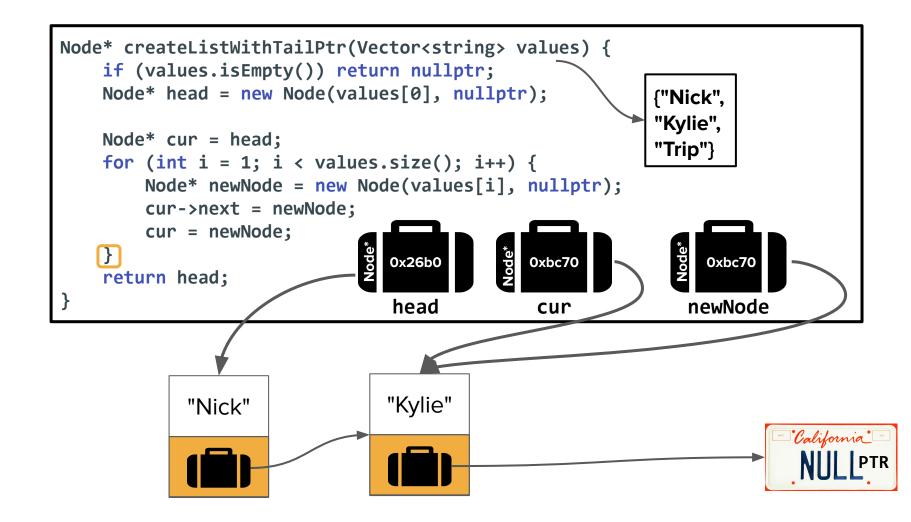

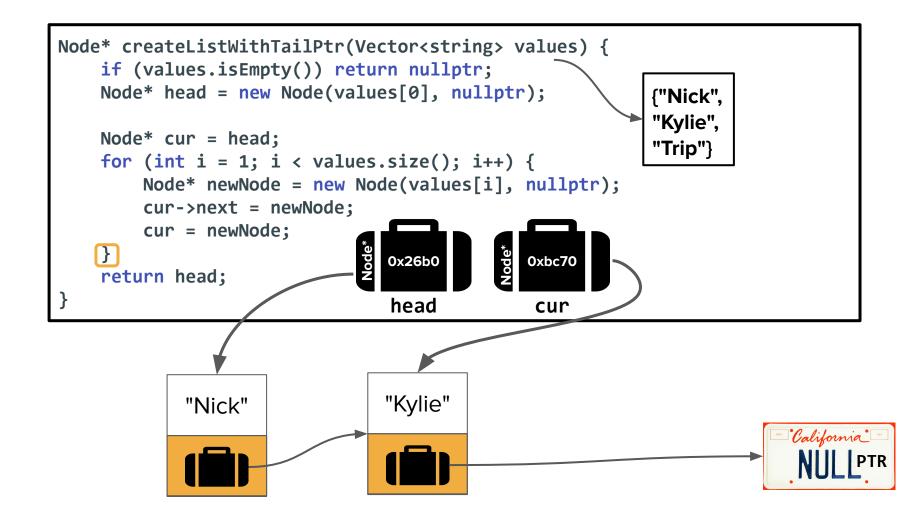

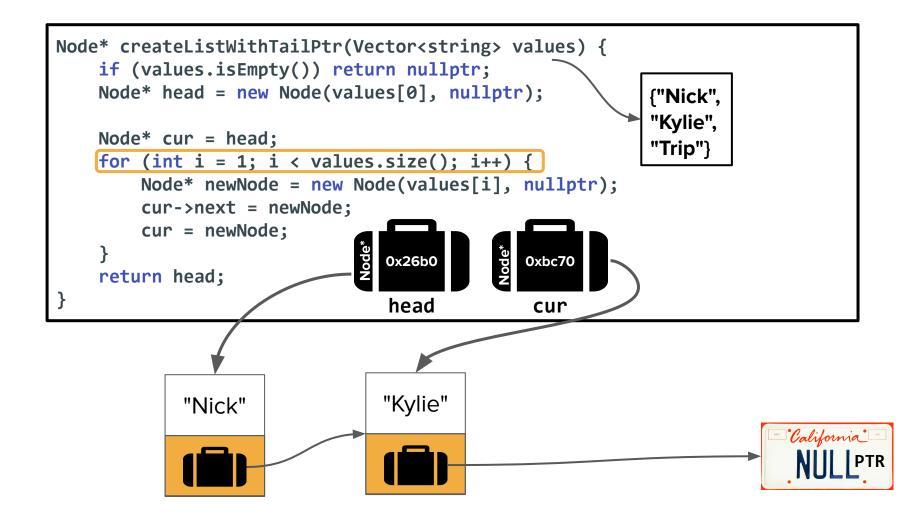

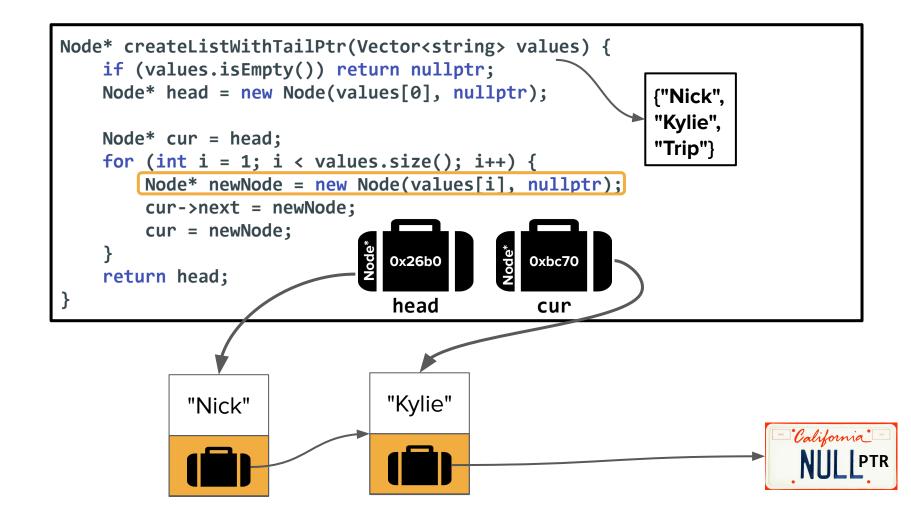

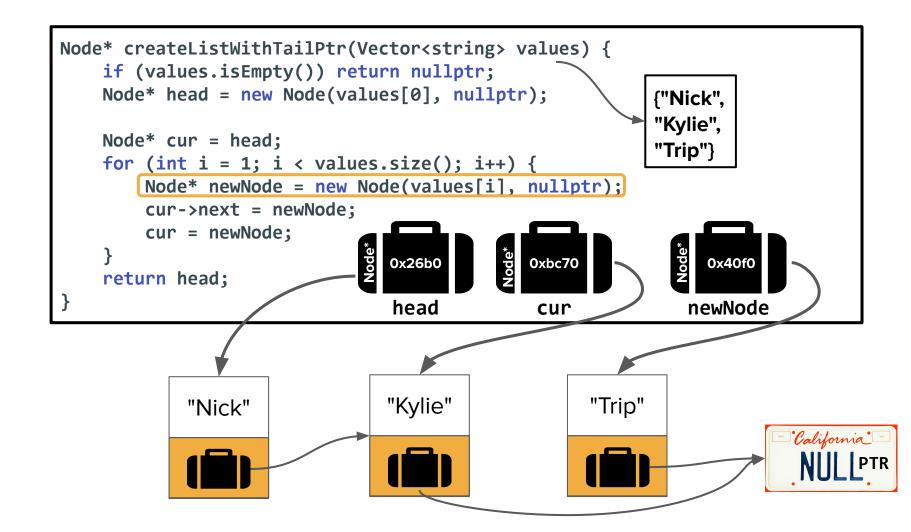

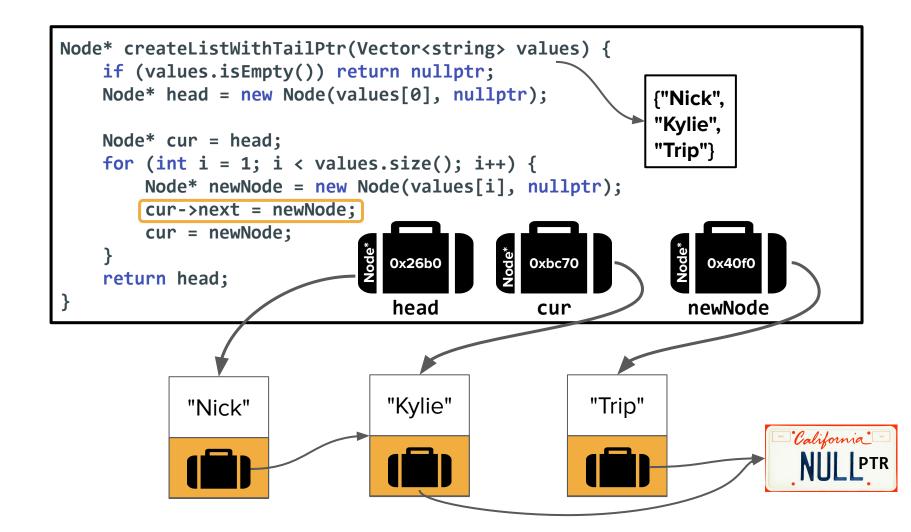

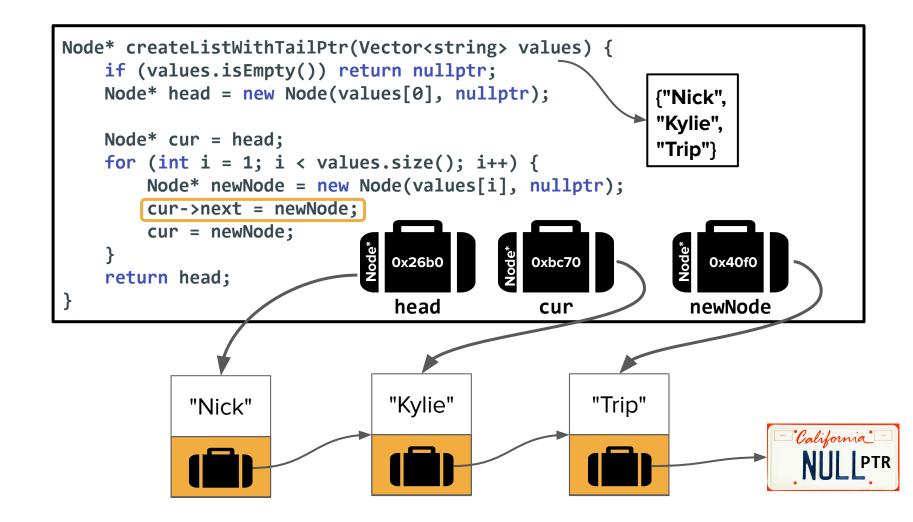

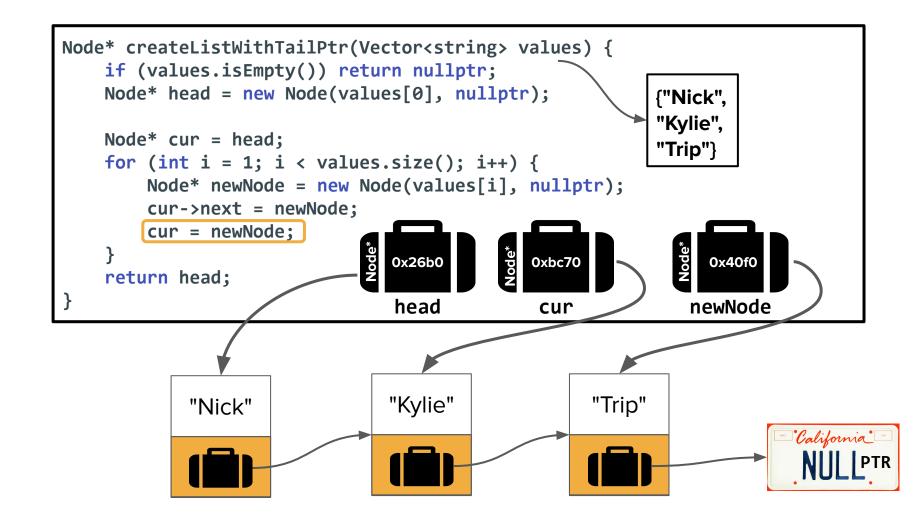

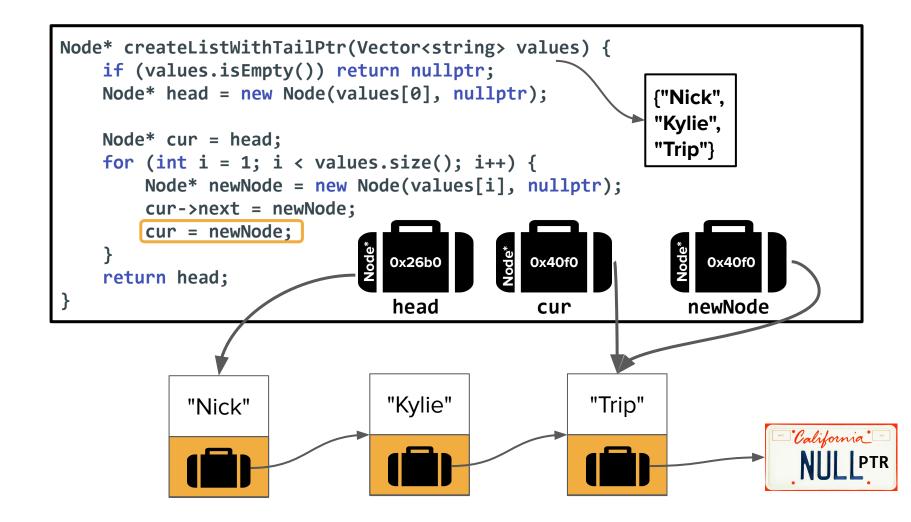

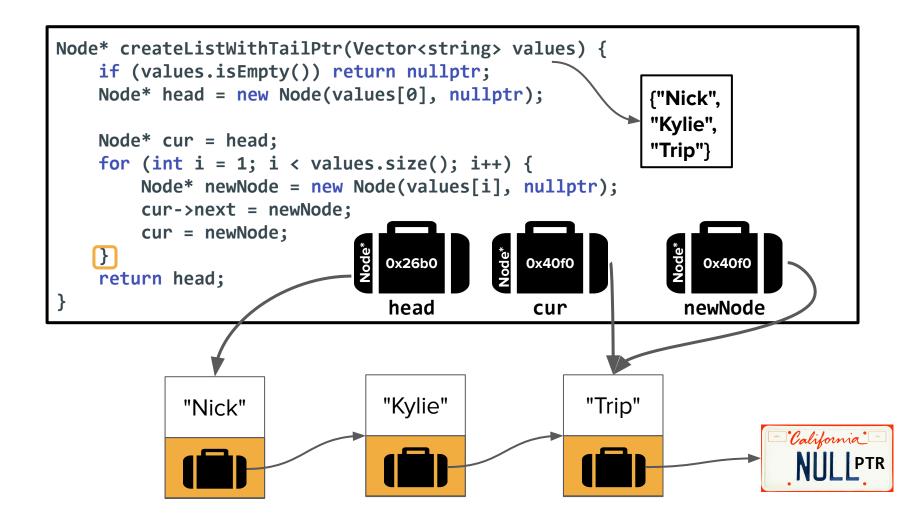

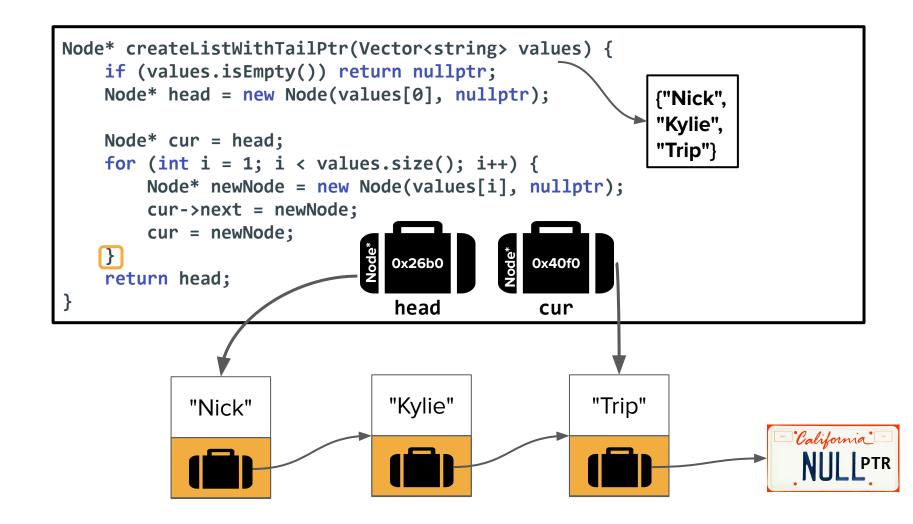

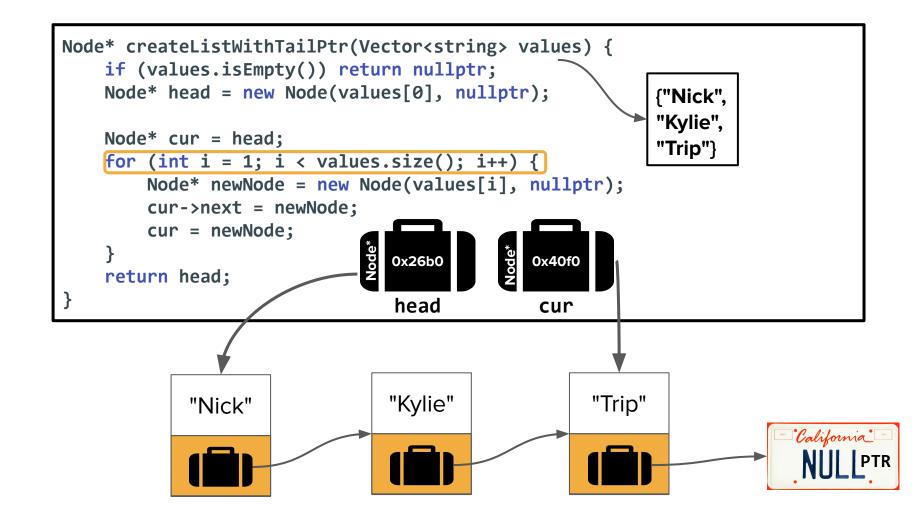

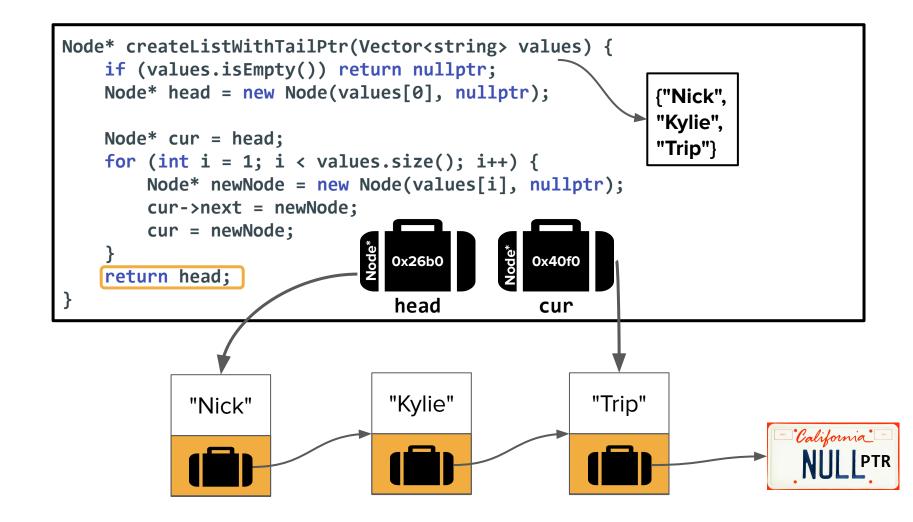

```
int main() {
    Vector<string> values = {"Nick", "Kylie", "Trip"};
    Node* list = createListWithTailPtr(values);
    /* Do other list-y things here, like printing/freeing the list. */
    return 0;
                                  0x26b0
                                  list
                                  "Kylie"
                                                   "Trip"
                 "Nick"
                                                                    California
```

We just built a linked list with the desired order of elements maintained in O(n) time. Awesome!

Manipulating the middle of a list

Insertion/deletion in the middle of a list

- Why might we want this?
 - To maintain a particular sorted order of the list
 - To find and remove a particular element in the list

Insertion/deletion in the middle of a list

- Why might we want this?
 - To maintain a particular sorted order of the list
 - To find and remove a particular element in the list
- We're going to write two functions:
 - alphabeticalAdd(Node*& list, string data)
 - remove(Node*& list, string dataToRemove)

Insertion/deletion in the middle of a list

- Why might we want this?
 - To maintain a particular sorted order of the list
 - To find and remove a particular element in the list
- We're going to write two functions:
 - alphabeticalAdd(Node*& list, string data)
 - o remove(Node*& list, string dataToRemove)

Note that we'll need to pass our list by reference!

alphabeticalAdd() -

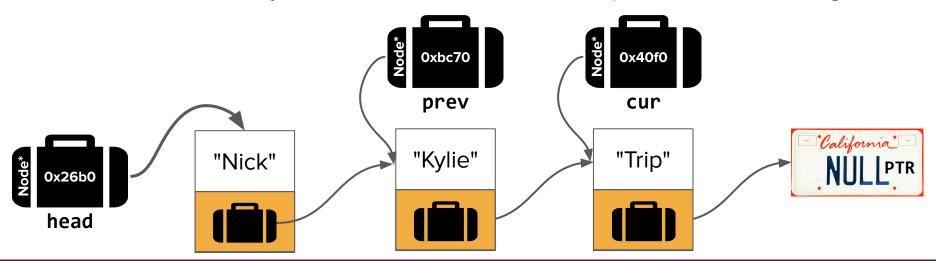

Let's code it!

remove() -

Let's code it!

Takeaways for manipulating the middle of a list

- While traversing to where you want to add/remove a node, you'll often want to keep track of both a current pointer and a previous pointer.
 - This makes rewiring easier between the two!
 - This also means you have to check that neither is nullptr before dereferencing.

Linked list summary

- You've now learned lots of ways to manipulate linked lists!
 - Traversal
 - Rewiring
 - Insertion (front/back/middle)
 - Deletion (front/back/middle)
- You've seen linked lists in classes and outside classes, and pointers passed by value and passed by reference.
- Assignment 5 will really test your understanding of linked lists.
 - Draw lots of pictures!
 - Test small parts of your code at a time to make sure individual operations are working correctly.

Announcements

Announcements

- Revisions for Assignment 3 will be due on Thursday, July 30 at 11:59pm PDT.
- Assignment 5 will be released by the end of the day today and will be due on Tuesday, August 4 at 11:59pm PDT.
- Diagnostic regrades are due on Thursday, July 30 at 11:59 PDT.
 - Note the new (extended) deadline!
 - Problem 4 has been completely regraded so please check Gradescope.
- Come talk to us (Nick/Kylie/Trip/an SL) about your final projects this week!
 - We're here to help you scope the problems and find something that interests you.

Sorting

What are real-world algorithms that can be used to organize data?

What is sorting?

This is one kind of sorting...

This is one kind of sorting...

This is one kind of sorting... but not quite what we mean!

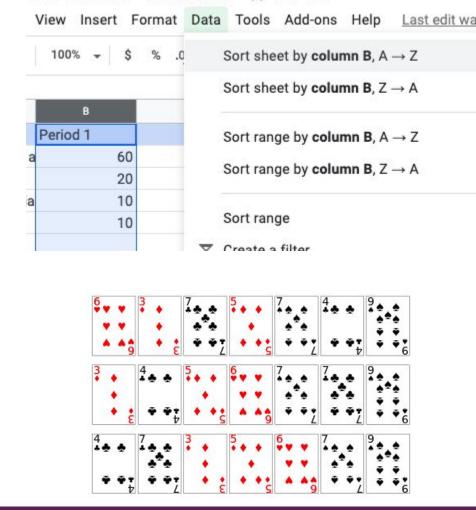

Definition

sorting

Given a list of data points, sort those data points into ascending / descending order by some quantity.

Why is sorting useful?

Time	Auto	Athlete		Nationality	Date	Venue
4:37.0		Anne Smith		United Kingdom	3 June 1967 ^[8]	London
4:36.8		Maria Gommers		Netherlands	14 June 1969 ^[8]	Leicester
4:35.3		Ellen Tittel		West Germany	20 August 1971 ^[8]	Sittard

Approaches to sorting

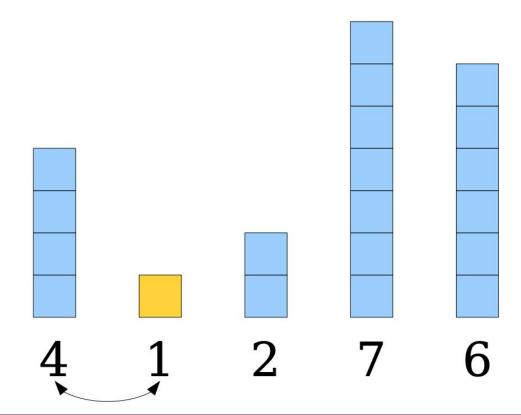

- Suppose we want to rearrange a sequence to put elements into ascending order (each element is less than or equal to the element that follows it).
- Over the next 2 days, we're going to answer the following questions:
 - What are some strategies we could use?
 - How do those strategies compare?
 - Is there a "best" strategy?

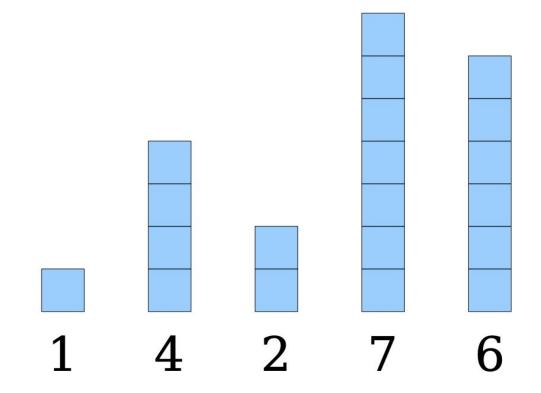

Sorting algorithms

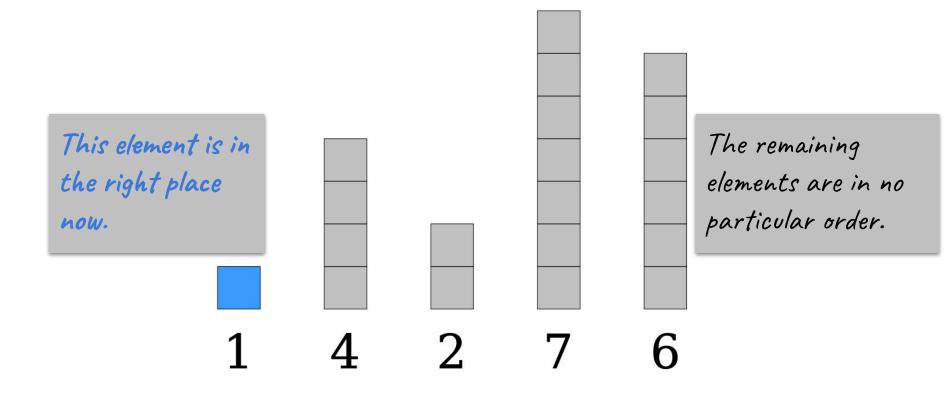

Animations courtesy of Keith Schwarz!

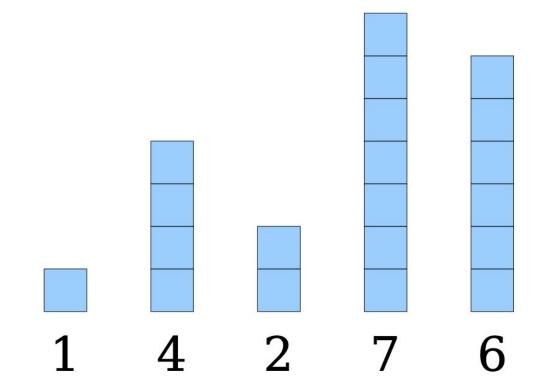

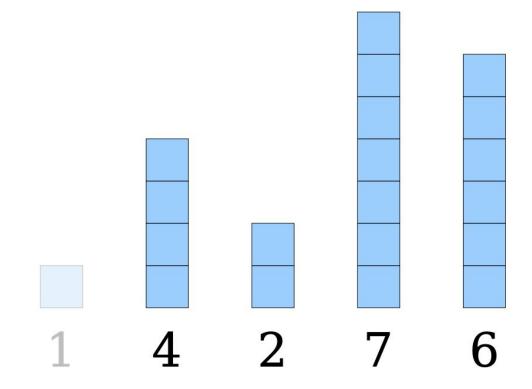

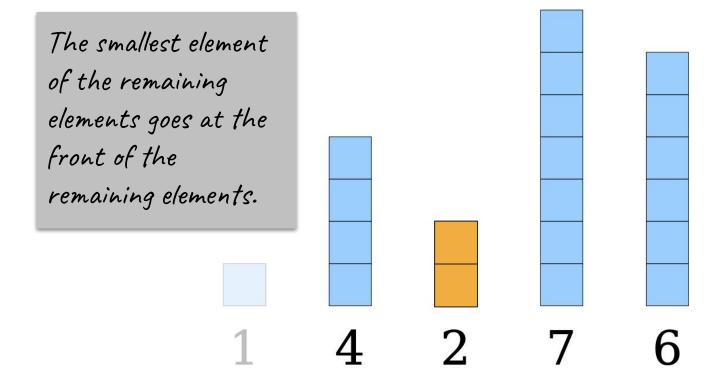

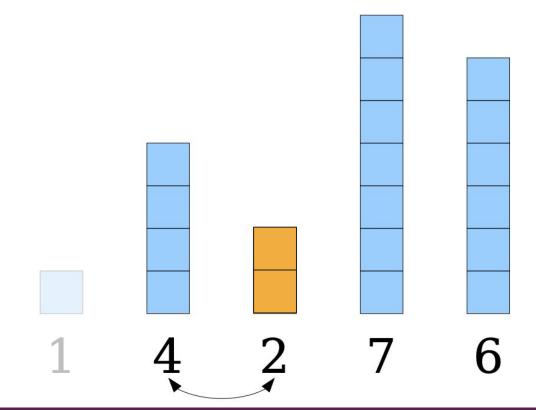

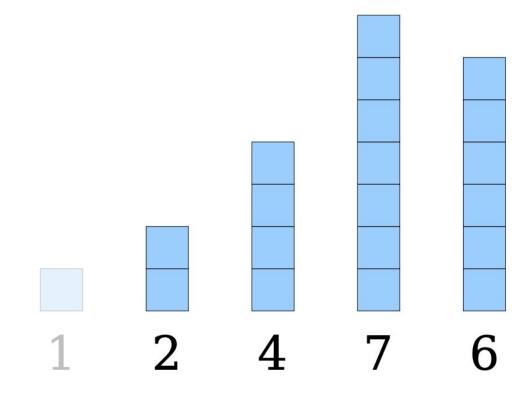

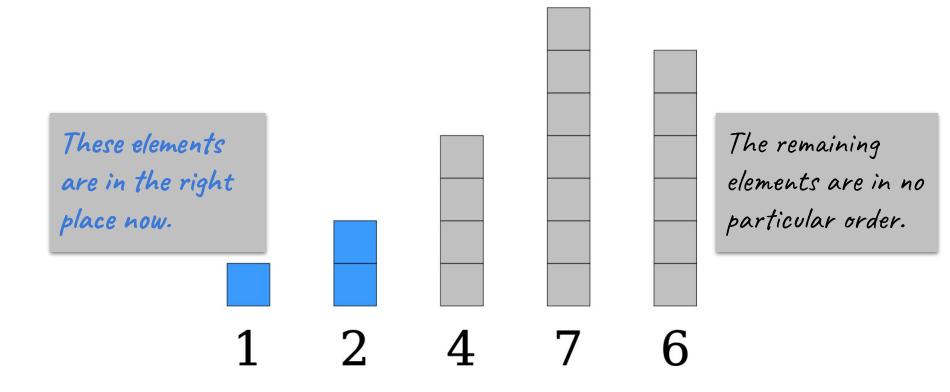

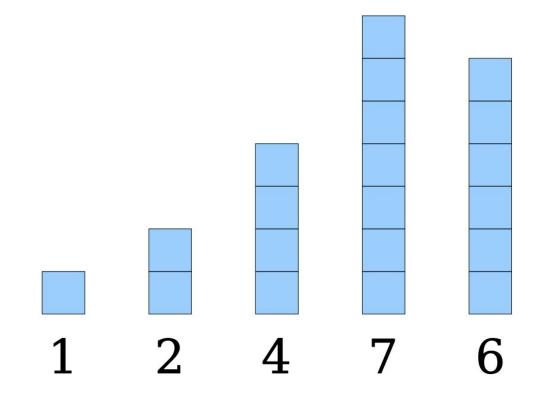

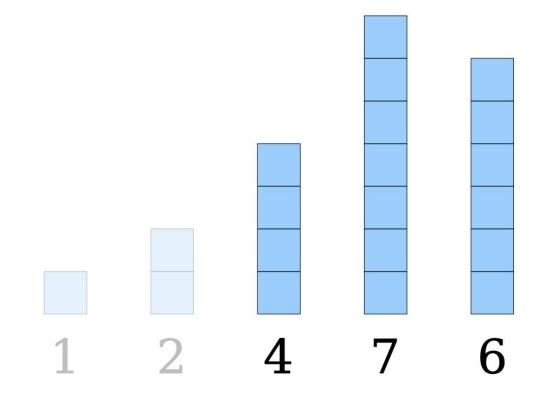

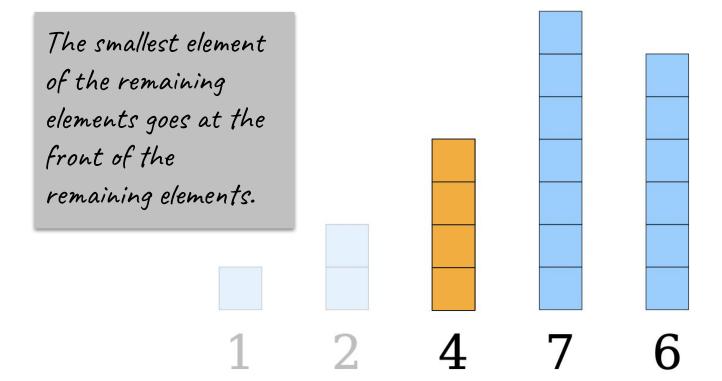

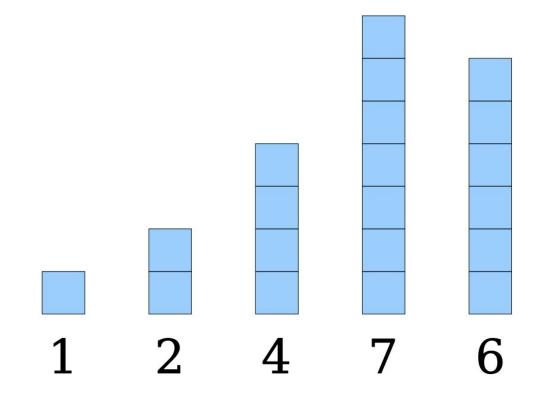

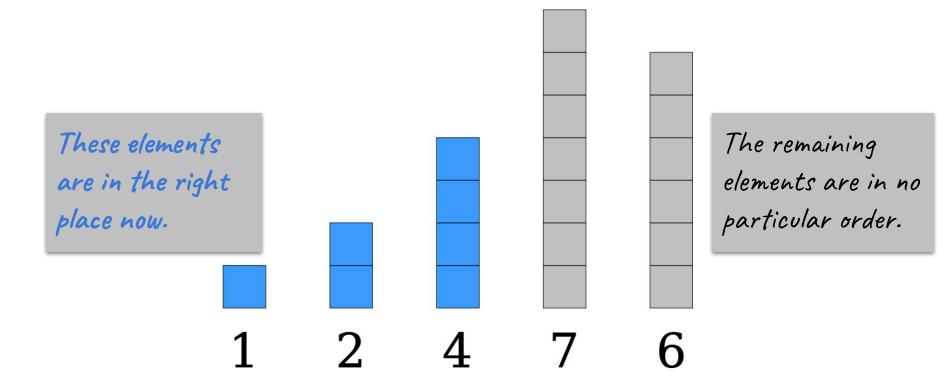

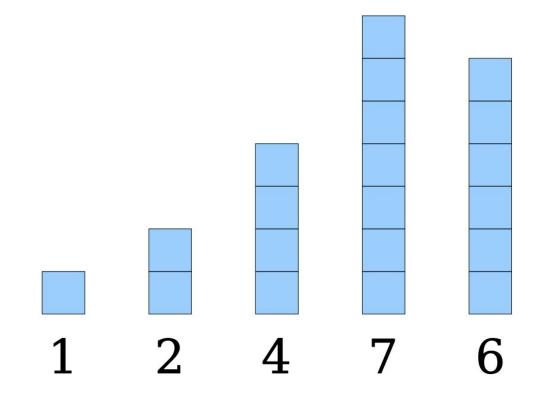

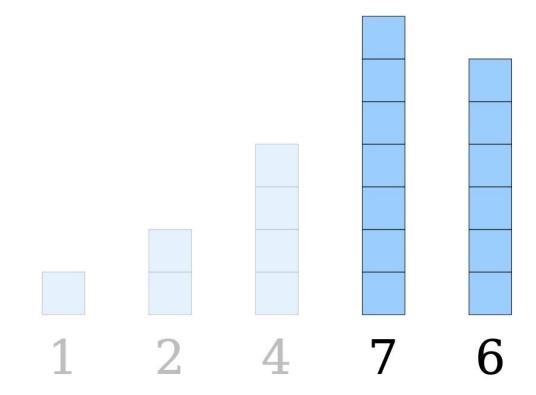

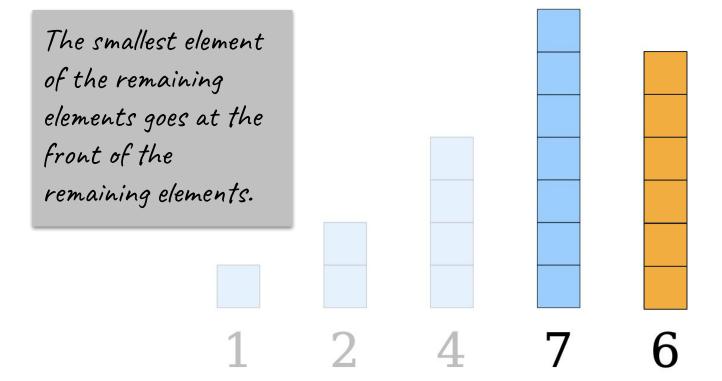

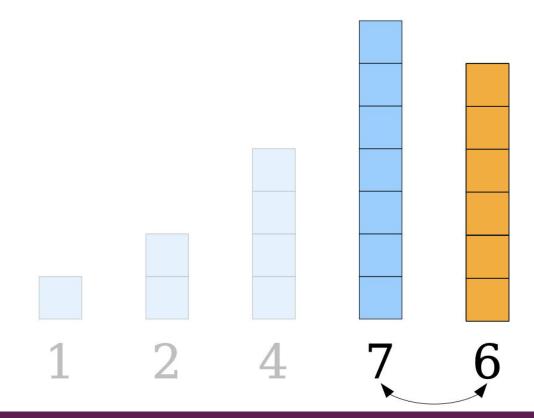

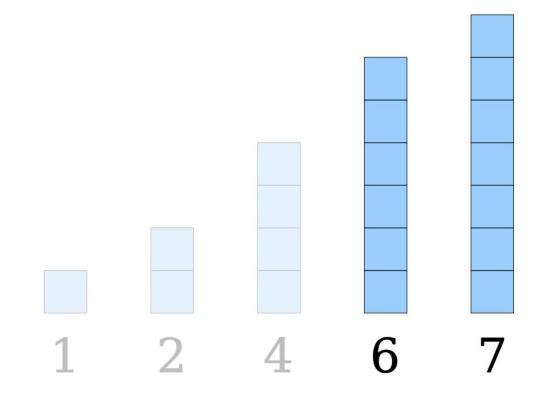

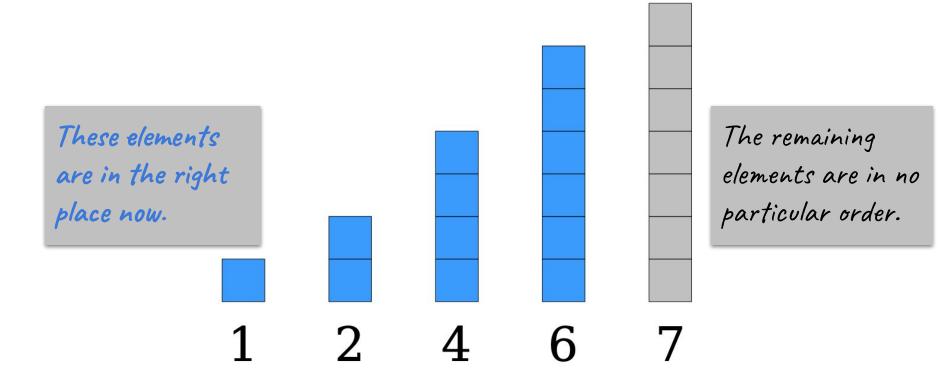

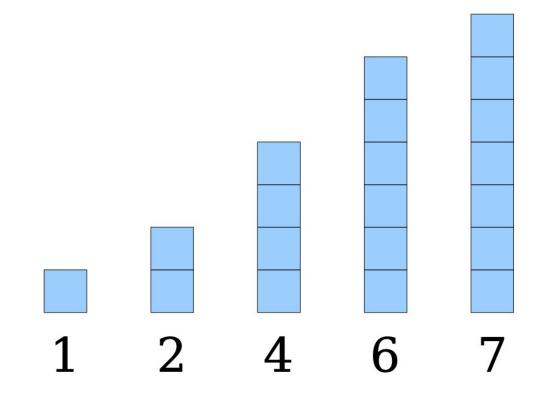

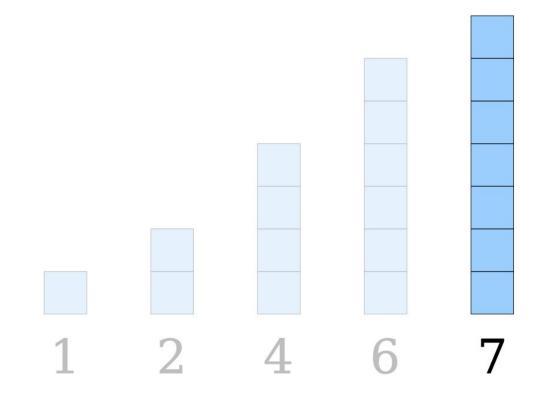

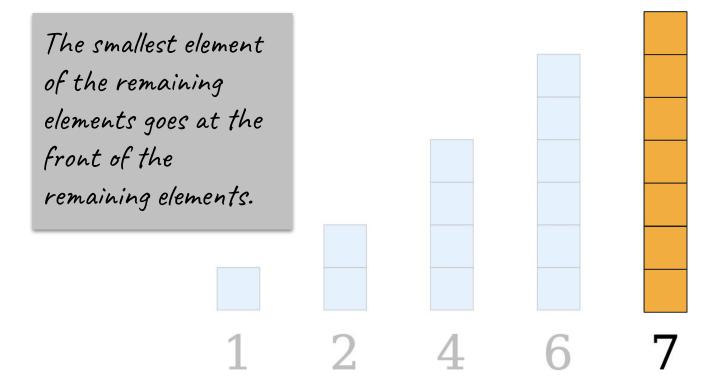

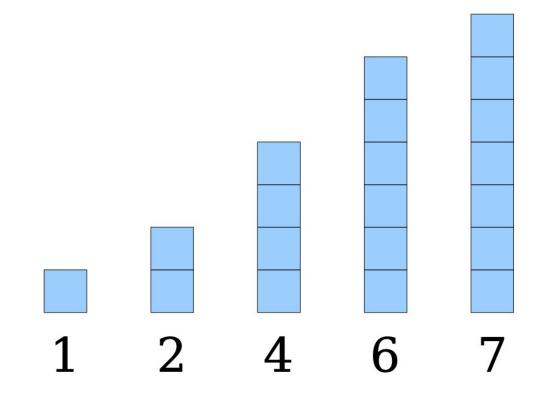

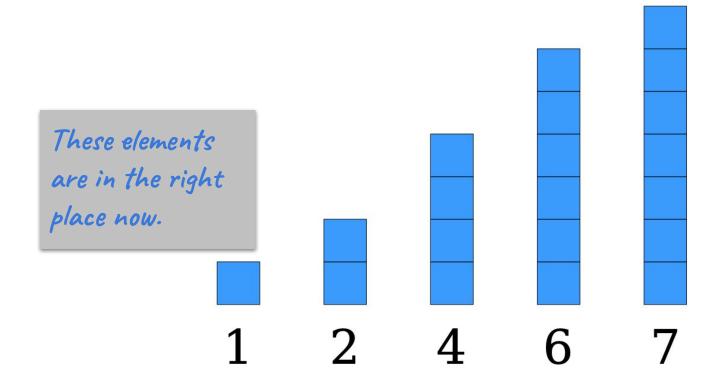

Selection sort algorithm

- Find the smallest element and move it to the first position.
- Find the smallest element of what's left and move it to the second position.
- Find the smallest element of what's left and move it to the third position.
- Find the smallest element of what's left and move it to the fourth position.
- (etc.)

```
void selectionSort(Vector<int>& elems) {
    for (int index = 0; index < elems.size(); index++) {</pre>
        int smallestIndex = indexOfSmallest(elems, index);
        swap(elems[index], elems[smallestIndex]);
* Given a vector and a starting point, returns the index of the smallest
* element in that vector at or after the starting point
*/
int indexOfSmallest(const Vector<int>& elems, int startPoint) {
    int smallestIndex = startPoint;
    for (int i = startPoint + 1; i < elems.size(); i++) {</pre>
        if (elems[i] < elems[smallestIndex]) {</pre>
            smallestIndex = i;
    return smallestIndex;
```

How much work do we do for selection sort?

- How much work do we do for selection sort?
 - \circ To find the smallest value, we need to look at all \mathbf{n} elements.

- How much work do we do for selection sort?
 - \circ To find the smallest value, we need to look at all **n** elements.
 - \circ To find the second-smallest value, we need to look at n 1 elements.

- How much work do we do for selection sort?
 - \circ To find the smallest value, we need to look at all **n** elements.
 - \circ To find the second-smallest value, we need to look at $\mathbf{n} \mathbf{1}$ elements.
 - To find the third-smallest value, we need to look at **n** − 2 elements.

Analyzing selection sort

- How much work do we do for selection sort?
 - \circ To find the smallest value, we need to look at all **n** elements.
 - \circ To find the second-smallest value, we need to look at n 1 elements.
 - \circ To find the third-smallest value, we need to look at n 2 elements.
 - This process continues until we have found every last "smallest element" from the original collection.

Analyzing selection sort

- How much work do we do for selection sort?
 - \circ To find the smallest value, we need to look at all **n** elements.
 - \circ To find the second-smallest value, we need to look at n 1 elements.
 - \circ To find the third-smallest value, we need to look at n 2 elements.
 - This process continues until we have found every last "smallest element" from the original collection.
- This, the total amount of work we have to do is is n + (n 1) + (n 2) + ... + 1

There is a mathematical formula that tells us

$$n + (n-1) + ... + 2 + 1 = (n * (n+1)) / 2$$

- Thus, the overall complexity of selection sort can be simplified as follows:

There is a mathematical formula that tells us

$$n + (n-1) + ... + 2 + 1 = (n * (n+1)) / 2$$

There is a mathematical formula that tells us

$$n + (n-1) + ... + 2 + 1 = (n * (n+1)) / 2$$

- Thus, the overall complexity of selection sort can be simplified as follows:

=
$$O(n * (n+1))$$
 Big-O ignores constant factors

There is a mathematical formula that tells us

$$n + (n-1) + ... + 2 + 1 = (n * (n+1)) / 2$$

Thus, the overall complexity of selection sort can be simplified as follows:

O Total work =
$$O((n * (n+1)) / 2)$$

= $O(n * (n+1))$
Big-O ignores constant factors
= $O(n^2 + n)$

There is a mathematical formula that tells us

$$n + (n-1) + ... + 2 + 1 = (n * (n+1)) / 2$$

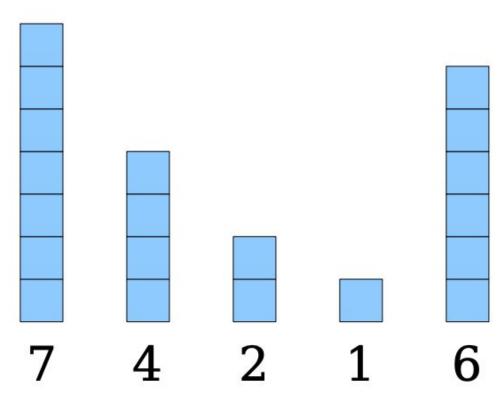

Thus, the overall complexity of selection sort can be simplified as follows:

Selection sort takeaways

 Selection sort works by "selecting" the smallest remaining element in the list and putting it in the front of all remaining elements.

- Selection sort is an $O(n^2)$ algorithm.
- Can we do better?
 - Yes!

Another take on sorting

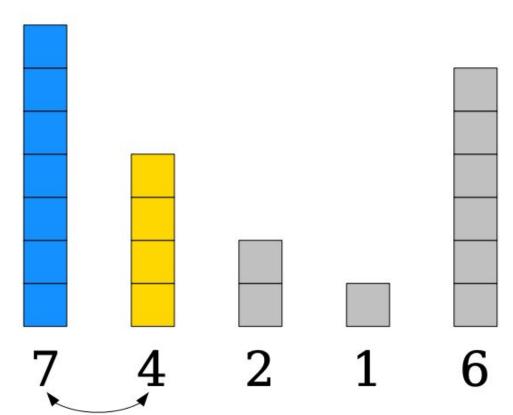

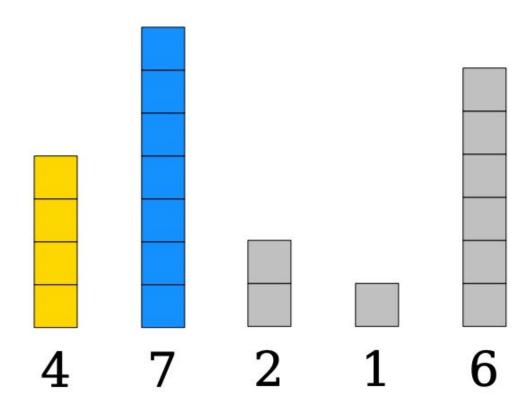

Considered alone, the blue item is trivially in sorted order because it is only one item.

7 4 2 1 6

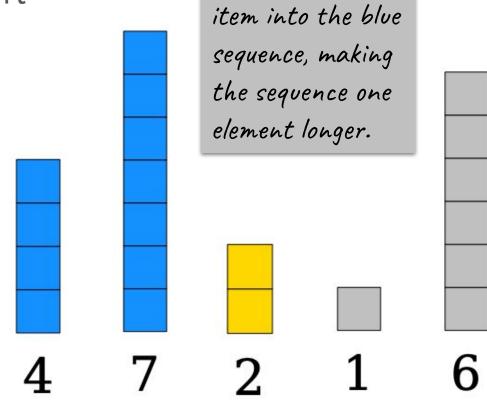

Insertion sort The items in gray are in no particular order (unsorted).

Insertion sort Insert the yellow element into the sequence that includes the blue element.

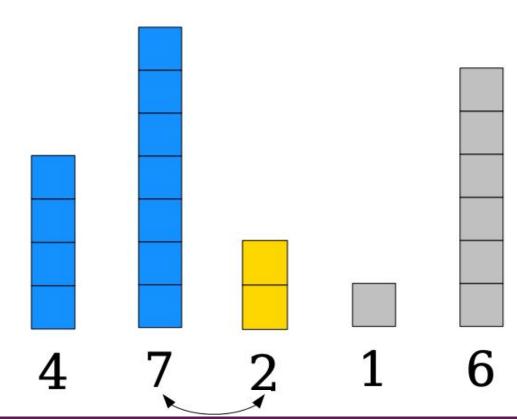

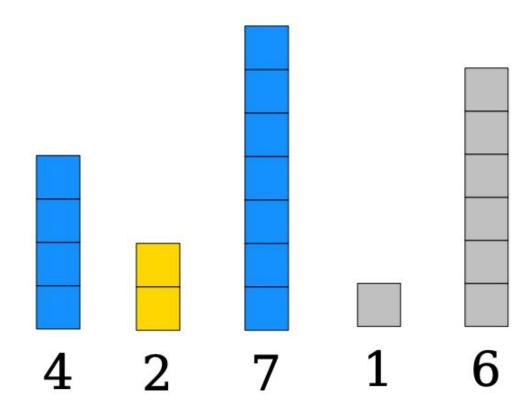

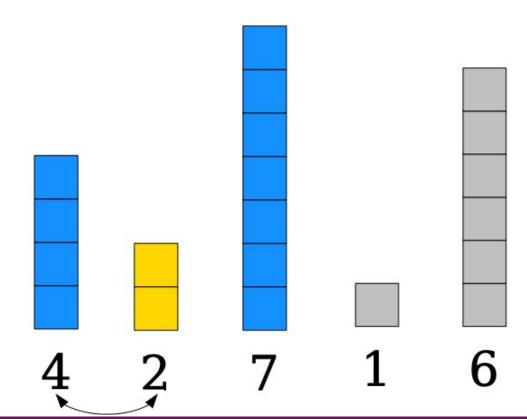

The blue elements Insertion sort are sorted!

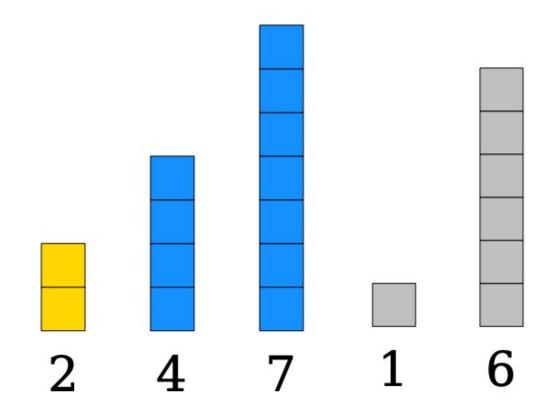

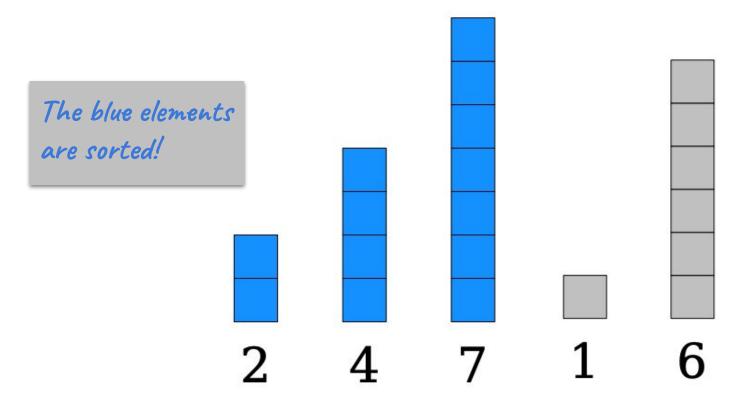

Insert the yellow

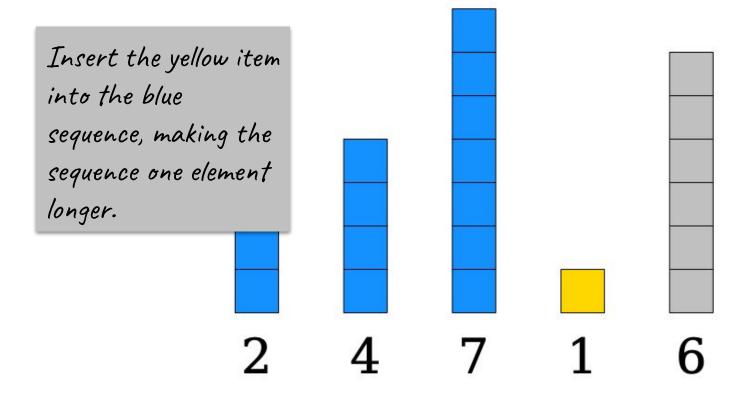

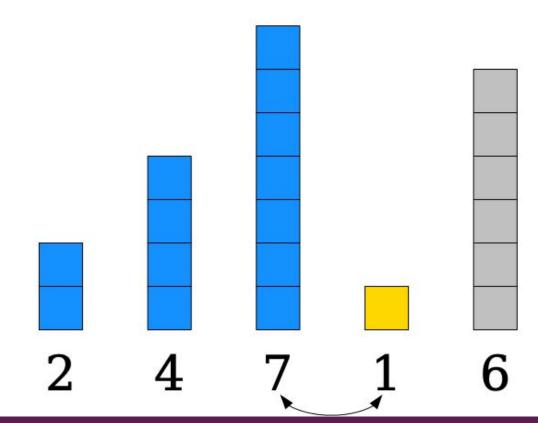

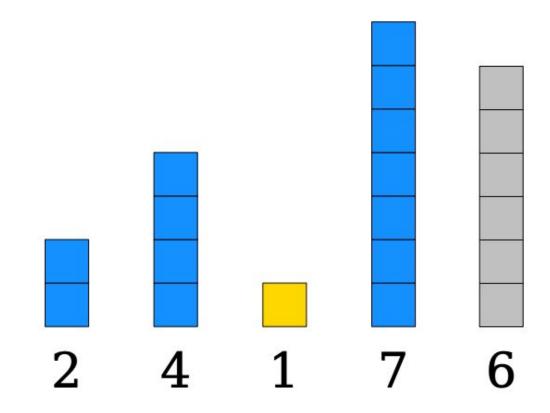

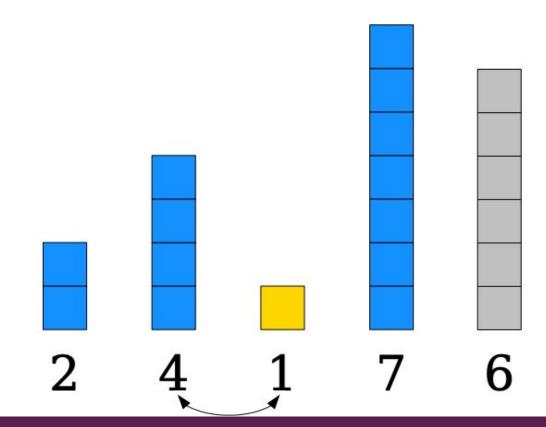

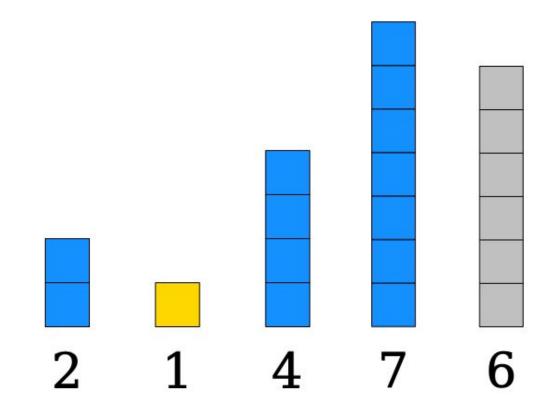

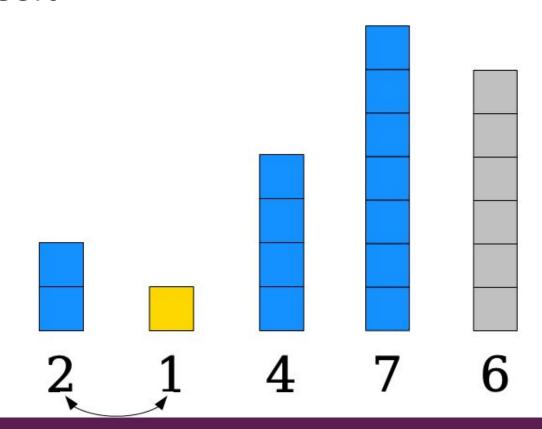

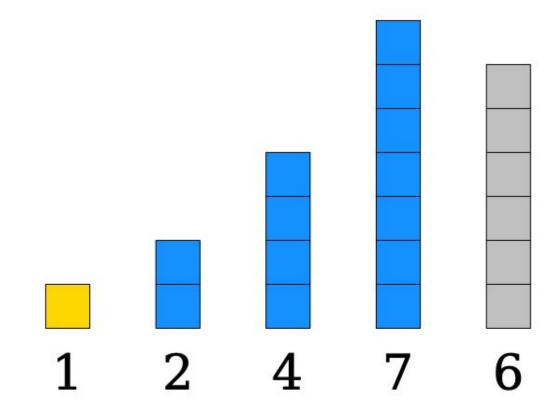

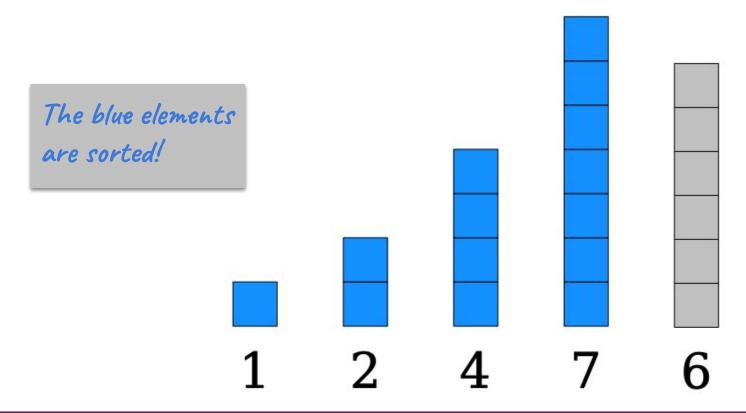

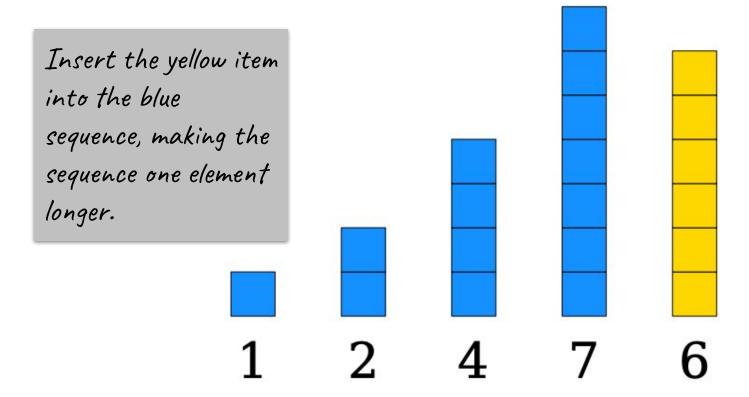

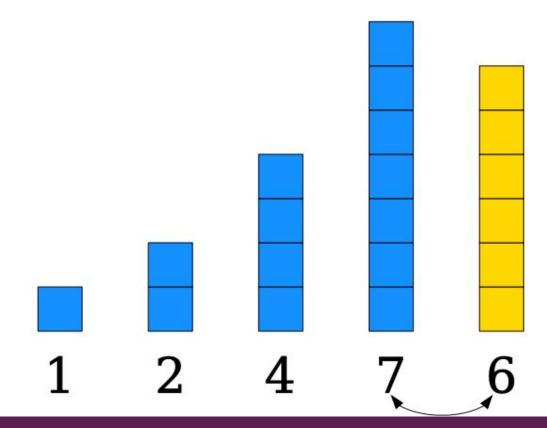

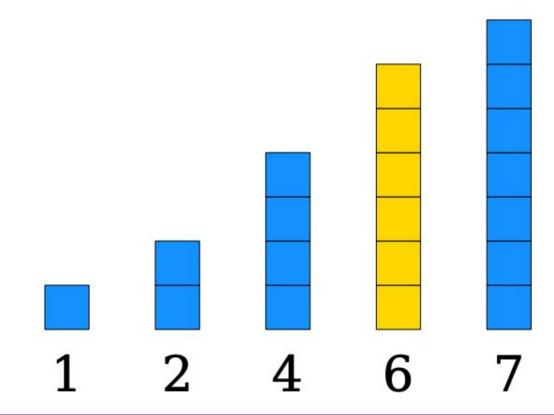

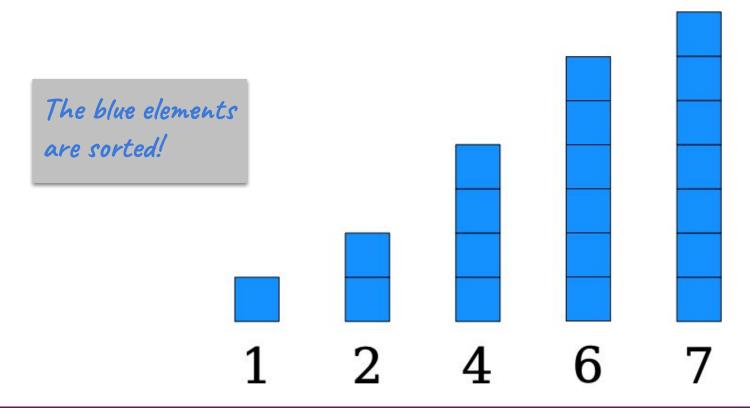

Insertion sort algorithm

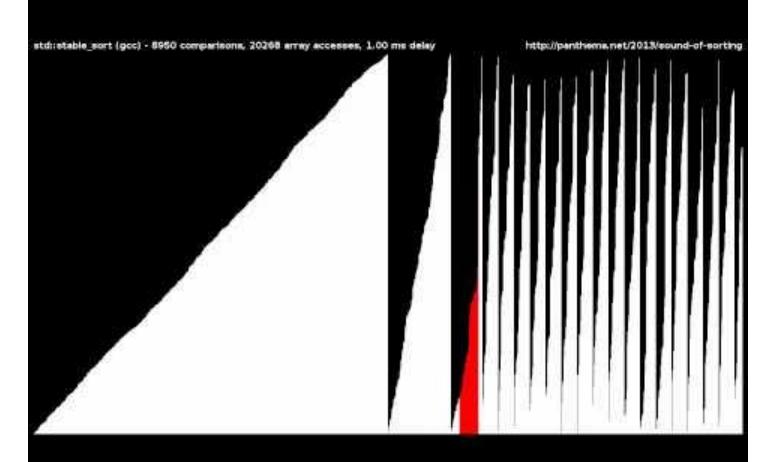

- Repeatedly insert an element into a sorted sequence at the front of the array.
- To insert an element, swap it backwards until either:
 - (1) it's bigger than the element before it, or
 - (2) it's at the front of the array.

Insertion sort code

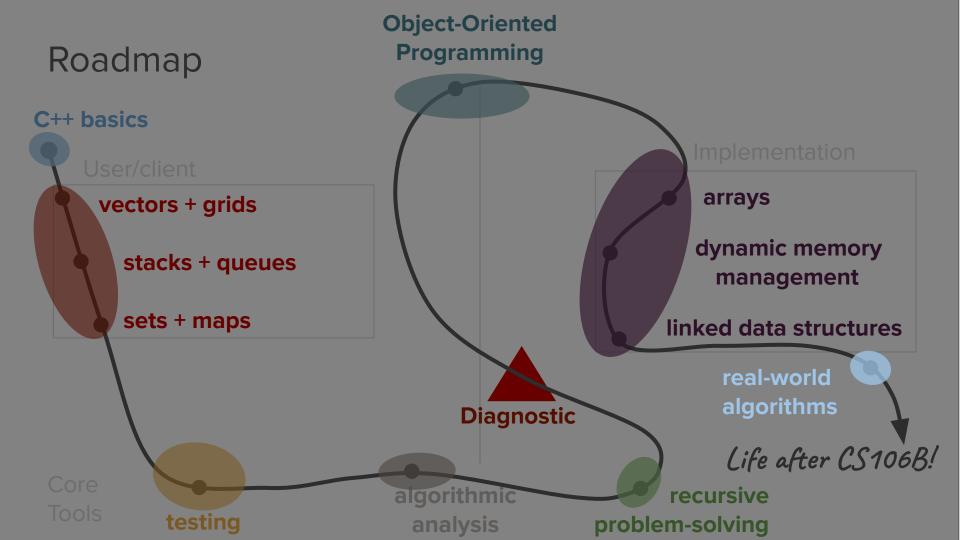

```
void insertionSort(Vector& v) {
    for (int i = 0; i < v.size(); i++) {
        /* Scan backwards until either (1) the preceding
         * element is no bigger than us or (2) there is
         * no preceding element. */
        for (int j = i - 1; j >= 0; j--) {
            if (v[j] \leftarrow v[j + 1]) break;
            /* Swap this element back one step. */
            swap(v[i], v[i + 1]);
```

- In the worst case (the array is in reverse sorted order), insertion sort takes time $O(n^2)$.
 - The analysis for this is similar to selection sort!
- In the best case (the array is already sorted), insertion takes time O(n) because you only iterate through once to check each element.
 - Selection sort, however, is always O(n²) because you always have to search the remainder of the list to guarantee that you're finding the minimum at each step.
- Fun fact: Insertion sorting an array of random values takes, on average, O(n²) time.
 - This is beyond the scope of the class take CS109 if you're interested in learning more!

Tomorrow, we'll see more efficient sorting algorithms that use "divide-and-conquer"!

What's next?

Mergesort and Quicksort
